

Intro to CSS - Worksheet

1. Set up site structure

2. Insert layout elements into index.html:

```
<body>

<div id="wrapper">Content for id "wrapper" Goes Here

  <header>Content for New header Tag Goes Here</header>

  <nav>Content for New nav Tag Goes Here</nav>

  <main>Content for New main Tag Goes Here</main>

  <footer>Content for New footer Tag Goes Here</footer>

</div>

</body>
```

3. Attach style sheet and create initial styling for body and wrapper.

4. Populate with content. The text for the web page can be found here:

Web 2 Files 1 > resources > text for pages > introduction text.docx

5. Create headings, lists, links etc and styling as required.

Finish index.html first before adding content to other pages.

When the first page is finished, save it as selectors.html and change the page content as appropriate.

When the second page is finished, save it as cascade-order.html and again change the content as appropriate for the page.
